

Kitchen Kompanion App

Group Members: Sarah Zhu, Amber Chen, Divya Lingala, Rica Asuncion

Development Platform: HTML/CSS/Javascript

Instructions

The initial html file is index.html. To launch the app, open the index.html in the unzipped file. The app is fully functional upon launch and there is no additional setup needed.

Upon launch of the app, the app defaults to the recipe book page. There is a navigation bar at the bottom of the screen for users to navigate between pages. This app has 5 pages - recipe book, kitchen contents, meal planning, grocery list, and profile. To navigate to a new page, simply click on any of the icons in the navigation bar.

Please refer to individual tasks in the task list and vertical design write-ups for detailed guides on how to use the tab page.

Task Example For Testing

Recipe Page

The user begins by navigating to the Recipes tab via the bottom navigation bar. The app displays a feed of recipe cards, and the user selects one to open the Recipe Detail View. This screen shows detailed information such as ingredients, preparation time, and step-by-step instructions. Any ingredient that is missing appears in red. If the user is missing an ingredient or has dietary restrictions, the app recommends substitutions—such as oat milk instead of dairy milk—based on what the user already has in their inventory. When a missing ingredient is not important to the recipe, the user can still proceed. When ready, the user enters Cooking View, where instructions are presented one step at a time, with step controls for previous step, next step, and view all steps. After completing the recipe, the app prompts the user to confirm success.

After completing a recipe, the user is prompted to rate it. They select a star rating from one to five. The feedback is stored and used by the app's personalization system to refine future recipe recommendations.

Kitchen Contents

The user navigates to the Kitchen Contents tab located in the bottom navigation bar. The dashboard provides four main filters: All, Available, Fridge, and Pantry; allowing users to filter items.

To add a new item, the user clicks on the + button next to the filters, and enters the item's name, location, and quantity, marking it as available. If the item already exists in the inventory, the user simply updates the quantity by expanding the item and clicking on the +/- buttons. This task helps maintain an accurate, up-to-date view of what's in the kitchen at all times.

In the Kitchen Contents tab, users can apply a filter to display only items currently available or to identify which items need to be restocked or bought. When an item is not available, it will appear as "Not Available" in the item information, but the item will not disappear from the list.

Grocery List

To create a new grocery list template, the user taps the New List (+) button, opening the list creation page. They then add items as usual: entering item names, quantities, and prices, making sure to click Add to actually add the item to the list. At the bottom of the page, the user is

presented with two options: Add to Templates or Create New List. Selecting Add to Templates saves the list as a reusable template for future use. Selecting the Create New List button will add the list to the screen as a current list.

To use a template, the user taps the Templates button located next to the New List button, opening the Template Library. From there, the user can click “Add” on any saved template to import it directly into their current grocery lists.

To add new items to any list, the user clicks on the + button in the list header. This brings up an “Add New Item” modal, where the user can input item information.

The user can also edit existing items by clicking on the pencil icon next to each item. If the user wishes to delete an item or list, they can click on the trash button.

As the user shops, they can tap any grocery list item to cross it off, visually indicating that the item has been purchased or acquired.

Meal Planning

In the Meal Planning tab, users can organize meals for each day of the week with separate sections for Breakfast, Lunch, and Dinner. Each slot starts with a “+ Add meal” button that opens a pop-up where users can enter a meal name, servings, prep time, and optional notes such as “no mushrooms.” After saving, the meal appears in that time slot with details and quick Edit or Remove options. Users can also click “Generate Plan” to automatically create a weekly schedule or Export it for future reference. The top of the page shows the current week, and users can switch between weeks to review or update their plans. This feature makes it easy to track what’s planned and personalize meals based on preferences or available ingredients.

For the meal planner tab, the user interacts with the weekly meal planner to add or modify a meal. They begin by tapping on an empty meal slot in the weekly layout—such as “Wednesday Dinner.” A pop-up form labeled “Add Meal” appears, prompting the user to enter key details including the meal name, number of servings, preparation time, and any optional notes. For example, the user might input “Chicken Fried Rice,” 4 servings, 35 minutes prep time, and a note specifying “no mushrooms.” Once the fields are completed, the user selects “Save Meal,” and the meal is added to the chosen slot, displaying its details directly within the weekly plan. If the user later decides to make adjustments, they can tap “Edit” to update the information or “Remove” to delete the meal entirely, with changes reflected immediately on the interface.

Within the Meal Planning grid, the user taps the ... icon beside any planned meal (for example, “Friday Lunch”) and selects Clear Meal from the dropdown menu. The selected recipe

disappears, and the cell resets to “+ Add Meal.” The app confirms the action with a short message: “Meal removed.”

Profile

The user navigates to the profile page and fills in their profile, including name, if they’re sharing the fridge or not, number of roommates, dietary restrictions, and cuisine preferences. The user then clicks on the Save Profile button at the bottom of the form to save their profile.

The user can also choose to Reset Profile by clicking the respective button at the bottom of the form to clear preferences.

If the user wishes to edit their profile, they can simply change any of the fields they filled in and click the Save Profile button again. When they relaunch the app (aka refresh), preferences will be saved.
