

Phase 2: Who Did What

Aditi Sethi: For the Phase 2 Checkpoint, I created the `transaction_page.html` page, which allowed users to enter all relevant information for each transaction they made, including the transaction name, date, amount, and category. The implementation of this page was based on the low-fidelity paper prototype developed in Phase 1.1.3. In Phase 2.1, I expanded the functionality and added `transaction_style.css` for styling and `chart_min.js` to provide interactive chart functionality that works offline. Based on feedback from the TA (Jim An) and Evan Golub, I added several new features to improve user experience: users can now create custom categories to organize their transactions, view a Transaction History section that logs every inputted transaction, and edit or remove any transaction from this history. Additionally, I implemented multiple sorting options for the transaction history, allowing users to sort by category or by date (most recent first or last), and when sorted by category, the total amount spent per category is displayed. I also added functionality to display a pie chart that visually represents spending across different categories. Beyond the transactions page, I updated the styling on the Deadlines, Goals, and Income pages to match the color scheme, fonts, and layout for consistency across the site and standardized the navigation bar on all pages. I contributed significantly to this report document, particularly in the first section detailing starting instructions and the shallow, moderate, and deep tasks. Lastly, I wrote and presented the Transactions section of the presentation video in Phase 2.2.

Melanie Chen: For this phase, I created the `goals.html` page, which allows users to manually enter in savings goals (front side of flippable card) and spending limits (a.k.a budgets) on the back side. For each, I made it so that users can initially add a Goal/Budget name and the associated Target/Limit amount, and update each by recording manual entries. For every category, I also added functionality so that users can view the Deposits/Transactions made to each, so the details are clearer overall. I also made the progress bars update as each Deposit/Transaction is recorded and turn green/red respectively as the limit is exceeded. Beyond this page, I also created custom pop-ups on `income.html` and `transactions.html` that

prompt the user to “Add to Savings?” or “Add to Budget?” as each income source and transaction are recorded, respectively. I made the “Add to Savings?” pop-up so that users can choose an existing savings goal or create a new one, decide what portion of their income stream to add to that goal, and have all the information be simultaneously updated on the “Savings” side of the goals.html page. I also made the “Add to Budget?” pop-up so that users can either choose an existing budget or create a new budget right on the transaction.html page. Similarly, all changes made in this pop-up are updated on the “Spending” side of the goals.html page. I also contributed to the shallow, moderate, and deep task explanations by detailing the flippable card and pop up functionalities. Lastly, I wrote and presented the Goals section (slides 17-21) of the presentation video in Phase 2.2.

Sammi: For this phase, I was responsible for building the entire income.html page, which allows users to add and track their different income streams. I implemented the full income entry form including name, three income types (hourly, lump, and annual salary) and their unique conditional fields. I also created the functionality that calculates income amounts automatically based on user input. If the user selects the “Hourly” income type, it would calculate the income entry to be the hourly pay times the hours worked. Similarly, if the user selects “Annual Salary” the income entry would be the annual salary divided by the pay frequency. After the calculation is complete, the final income is what is added to the “Total Income” banner. Similarly, as the final income is added to the header, the individual entry would be stored in an income ledger. I also developed the ledger pop-up enabling users to view their complete income history, remove individual entries, or clear all entries with a confirmation notice. Beyond the page’s functionality, I wrote the entire horizontal analysis for the app explaining how all four pages (Deadlines, Income, Transactions, and Goals) evolved from Phase 1 and how the design, layout, navigation, accessibility, sequencing, and grouping decisions were improved across the entire system. I also contributed to the vertical analysis by writing how the Income page interacted deeply with the Goals page. For the presentation, I wrote and presented slides 8-12 which covered the Income page’s overview and demonstrations of its functionality.

Aidana: For this phase, I was responsible for building the entire deadlines.html page, which allows users to keep track of financial deadlines and tasks. I revised the interface so that Deadlines and To-Do List are on separate tabs that the user can switch between, instead of scrolling endlessly on one screen. The user can add, view, edit, and delete deadlines. I created the functionality that color-codes the deadlines by urgency – red for passed dates and orange for ones that are coming up soon. The user is able to choose between earliest first and latest first sorting from the dropdown menu. In the To-Do List tab, the user can add, view, edit, delete, and check-off tasks. Completed tasks are saved in the history section, accessible through the “View History” button, with a timestamp of completion. Users can click on completed tasks in the history pop-up and view their notes for that task. I implemented internal scrolling for both Deadlines and To-Do lists. For subphase 2.1, I wrote the starting instructions and a portion of the shallow and moderate tasks. I wrote and presented the Deadlines section of the presentation video in subphase 2.2. Lastly, I merged all of my group members’ video clips into one video presentation for submission.

Salary Breakdown

Aditi Sethi: \$25

Melanie Chen: \$25

Sammi Peguero: \$25

Aidana Aibek Kyzy: \$25
