

Slides 1-6 (Aidana):

Hi my name is Aidana and our group ended up going with the budgeting app option for our project. We have developed 4 main features – deadlines, income, transactions, and goals. I will be presenting the deadlines feature.

Deadlines is the first feature that shows up on the nav bar. The user can switch between deadlines and to-do list tabs. On the deadlines tab, the user can add upcoming deadlines by entering a name, date, and some notes. They can update and delete deadlines. They can view their notes by clicking on that deadline in the list. They can sort deadlines by earliest date first or latest date first. The deadlines show up color-coded. So, a red date means that the deadline has passed, and orange means that it's coming up soon.

The user can then switch to a to-do list tab, where they can add tasks to a list by entering a name and some notes. They can view their notes by clicking on that task in the list, and they can update, delete, and check off tasks. Checked off tasks go into a history section where they are shown with a timestamp of completion and the user can view the notes of a completed task by clicking on it in the history pop up.

So, for example, the user wants to input a utility bill deadline. They would put utility bill in the name field, choose the 22nd of November for the date, and add some notes. So, they want to Venmo their roommate Rachel \$50. They can add it to the deadlines list and they're color coded by urgency. They can edit the notes inside the deadline and then that edit is saved. The user also has rent and auto loan in there. They can sort by earliest or latest first. And they can remove a deadline.

The user can switch to the to-do list section and add a task. So, they want to cancel a subscription. Specifically, they want to cancel Netflix. So, they add that to the list and it goes to the bottom. They can edit the subscription to Hulu instead. That gets saved. The user can remove a task or they can check it off as completed. Completed tasks go to the history section, where they can be viewed and the user can see the notes for it as well.

Slides 7-11 (Sammi):

Hi my name is Sammi and I will be presenting the Income page of our app.

In the app, users will be able to add new sources of income onto the page by entering the name and selecting the type of income. Once they select a type of income there will be some additional information to provide based on their selection.

Once the user saves their income, there will be a prompt asking if they want to add a portion of their income to a savings goal. If yes, they would need to enter an amount and select the savings goal via the dropdown menu. This pop up is directly linked to the Goals page so if the user wants to add a portion of their income to a previously made savings goal it will appear in the dropdown or if they would like to create a new goal they can select create new goal.

Every time a user adds an income it will be saved under the income ledger. To see their income history they can click View Ledger and it will take them to a summary table of their income streams. The users will have the ability to remove a single entry or clear the entire ledger.

Any time income is added or removed the income header at the top of the page will update based on the changes.

To demonstrate, the user will try to add all three types of income.

First, they will enter the title of the income to add and select the income type. In this case hourly.

Because they selected hourly they have to enter their hourly pay, hours worked and the date of income earned and press save income.

This popup will ask if they would like to add to their savings.

We calculate the maximum amount to add by multiplying hours worked by hourly rate, in this case that's 320

Since the user has no goals created they will need to create a new goal. So they will enter the name as well as the target amount and press confirm.

...

Next they will enter some freelance work so they will select lump sum

They will now enter the amount earned, the date and some optional notes and finally press save income

...

Finally they will add their annual salary as a software engineer.

They will enter their salary, the pay frequency and the date.

For annual salary the maximum amount will be the salary divided by their pay frequency in weeks. That maximum amount will also be what is added to the income ledger.

To view the ledger the user will press view ledger and it will show all the previously entered income information.

They can select clear all to delete every entry from the ledger or just simply remove a single entry.

By removing an entry, it will adjust the total income in the ledger as well as the header at the top of the page.

By removing all entries, it will reset the income ledger as well as set the total to 0.

To put it more simply, the entries added directly affect the income header. By adding or removing entries the income header will be adjusted to reflect the total in the income ledger.

Slides 12-15 (Aditi):

Hi! My name is Aditi, and I'll be presenting the Transactions page of our budgeting app.

In the app, users can add new transactions by going onto the Transactions Page entering the name, date, category, and amount spent. They can also create custom categories to better organize their transactions.

Transactions can be linked to budget categories, which appear on the Goals tab. Users can also add new budget categories that aren't already listed there.

Every time a transaction is added, it's automatically saved in the Transaction History. The history can be sorted by category or by date, and each transaction can be edited or deleted if needed.

Finally, the app includes a visual representation of spending in the form of a pie chart. This chart shows a breakdown of spending by category, helping users understand where their money is going.

On the home screen, the user starts by adding a new transaction. They enter the transaction name, Trader Joe's, the amount, \$57, the date, November 8th, 2025, and choose the Food category.

Next, the user creates a new budget category for Food with a total budget of \$200.

After creating the category, they add the Trader Joe's transaction into this Food budget category.

The user then navigates to the Goals tab. Under the Spending section, they can see that \$57 out of the \$200 Food budget has been spent. This shows how the app automatically tracks spending and updates progress toward each budget goal.

Now, in the Transactions tab, the new transaction has automatically been added to the History section.

Here, users can sort their transactions by category, which shows category totals and a visual pie chart displaying how their spending is divided. They can also sort chronologically, either from the most recent first or oldest first.

Each transaction can be edited or removed. For example, the user notices that they accidentally entered \$17 for a Chipotle transaction. They click the Edit button, and a small pop-up appears allowing them to change the amount. They correct it to \$19, and the transaction history updates automatically.

Slides 16-20 (Melanie):

Now, let's move on to talking about the Goals tab. Like Aditi and Sammi mentioned before, our application has the function to add a set of goals, either for savings or spending. This functionality can be accessed when either adding an income stream or a transaction (which will thus be reflected on the Goals tab), but can also be accessed and edited ad hoc on the actual Goals tab itself.

In the next couple of slides, I will showcase the functionality of users manually adding goals/limits on the Goals page itself.

But to briefly go over a couple of key features:

(1) First, I integrated a flippable card mechanism on the Goals tab, to allow for greater interactivity and to spread out the information a little more. If both the spending and savings functionality were on the same page, there would be needless scrolling and a good amount of clutter.

(2) Users can also update existing goals by entering individual entries using the “Record” button on each side of the card, and view the individual deposits/expenses using the dropdown arrow to the right of each goal.

(3) The last key feature available on the Goals tab is the progress bar visualization for each goal. The fill of the progress bar and percentage associated will update as each goal progresses. Ultimately, it will reflect either a green or red color instead of the default blue/gray color once the goal has been reached/exceeded.

Savings Slide:

Here, I have a still image of the Savings side of the card at a glance (left), and a screen capture video demonstration of its functionality with a couple examples (right).

If you would like to take a closer look at the functionality in the still image, I’d recommend that you pause the video now.

In my video demonstration, I entered a made-up goal category of “Vacation to Bali”, and a “Target” amount of 2000. I then enter this goal category into the ledger by clicking the “Add” button.

I then showcase adding individual entries to this existing category, by recording an initial expense of 23, and a second expense of 500. As you can see, with each entry that I make, the progress bar and percentage (in parentheses) increases accordingly, reflecting that blue/gray color towards the total limit of 2000.

For my second example, I create a goal category of “Tuition” with a goal of 1000. For this category, I record a deposit of 1000. As you can see on the screen, the progress bar immediately turns green, reflecting how the set goal has been reached. The percentage also updates accordingly, reflecting a value of 100%.

Finally, I showcase how the user can click on the dropdowns next to each goal to view the individual deposits that make up a goal category, and how the total amount saved overall is reflected in the right corner of the card.

Spending Slide:

Moving on to the Spending side of the Goals tab. On the left, there is a still image of the Spending side of the card at a glance (left), and a screen capture demonstration of its functionality with a couple examples (right).

Again, if you would like to take a closer look at the functionality in the still image, I'd recommend that you pause the video now.

Here in the video, I showcase the flipping mechanism by flipping from the savings side (default side) to the blank spending side.

Here, I enter in my made-up budget category of "Take Out Food". In the "Limit" box, I enter 400. I then enter this budget category into the ledger by clicking the "Add" button.

I then showcase adding individual entries to this existing category, by recording an initial expense of 10, and a second expense of 30. As you can see, with each entry that I make, the progress bar and percentage (in parentheses) increases accordingly, reflecting that blue/gray color towards the total limit of 400.

For my second example, I create a budget category of "Shopping" with a limit of 200. For this category, I record an expense of 250. As you can see on the screen, the progress bar immediately turns red, reflecting how the set limit has been exceeded. The percentage also updates accordingly, reflecting a value over 100%.

Finally, I showcase how the user can click on the dropdowns next to each limit to view the individual expenses that make up a budget category, and how the total amount spent overall is reflected in the right corner of the card.

Conclusion:

So, functionality of the two sides of the card are very similar, but they do serve two different purposes. That is it for our presentation, thank you for listening, and I appreciate your time.
